Problem

Most users face difficulties matching clothing colors appropriately and waste time searching for outfit ideas across multiple websites. Additionally, when they find attractive outfits in inspiration images, they do not know where to conveniently purchase authentic items.

Who faces this problem: Fashion Shoppers and General Users.
Why is it important / What it costs them right now: Users waste time aimlessly searching for ideas, lose opportunities to build confidence through personal styling, and risk buying fake or incorrect products due to unclear store links.

Real Users

MVP Shape

Main Features 3–5 items (FR):

- FR-1: Utilize Al to analyze clothing colors for matching and retrieve style data from various sources for recommendations.
- FR-2: Display purchasing links redirecting to official stores.
- FR-3: Bookmark system to save favorite styles for later viewing.
- FR-4: Style sharing system allowing users to upload and post their outfits.
- FR-5: User profile and data saving system.

Which FR involves "real logic or decision making" (not just add-delete-edit):
FR-1: It processes user inputs (such as color keywords or clothing items) through AI reasoning algorithms and analyzes trend data from external sources to evaluate and recommend suitable style combinations.

What data must be persisted during usage:
User profile credentials and authentication state, User's bookmarked/saved style records, and User-uploaded posts, photos, and shared style details.

Access

Data / license / systems required and how to verify access:

1. **External AI API / Provider:** Used for analyzing images, styling, and color matching. (Verified by testing request/response payloads using an API key on the provider's developer console.)

2. **Official Store Links:** Used to redirect users to authentic brand product pages. (Verified by testing URL redirection to brand sites and running automated link-checking scripts.)
